

JavaScript Function - Theory Notes

1. What is Function?

Function is a reusable block of code used to perform a task.

2. Syntax

```
function greet() {  
  console.log('Hello');  
}
```

3. Call Function

```
greet();
```

4. Parameters

Values received by function.
function add(a,b){}

5. Arguments

Values passed while calling.
add(10,20)

6. Return

return sends value back from function.

7. Types of Functions

Normal function, Function expression, Arrow function, Anonymous function, Callback function.

8. Scope

Variables inside function are local.

9. Benefits

Reuse code, better organization, less repetition.

10. Real Uses

Login, calculation, validation, API call, button click.

11. typeof

typeof functionName -> function

12. Best Practice

Use meaningful names like `getUser()`, `calculateTotal()`.

13. Quick Revision Table

Feature	Example
Create	<code>function add(){}</code>
Call	<code>add()</code>
Return	<code>return x</code>
Arrow	<code>(a,b)=>a+b</code>
typeof	<code>function</code>
