

JavaScript Null Datatype - Notes

What is Null?

Null means an intentionally empty value.

It is assigned when you want to say: value exists but currently empty.

Examples

```
let a = null;  
console.log(a) -> null  
typeof a -> object
```

Common Uses

1. Clear old value
2. Empty database field
3. No selected item
4. Value intentionally blank

Null vs Undefined

null = intentionally empty

undefined = value not assigned

Comparison

null == undefined -> true

null === undefined -> false

Boolean Conversion

Boolean(null) -> false

Important Note

typeof null -> object

This is a historical JavaScript behavior.

Best Practice

Check using:

value === null
