

JavaScript const Variables - Notes

1. What is const?

const is used to declare variables whose reference/value should not be reassigned.

2. Syntax

```
const a = 10;
```

3. Must Initialize

const must be assigned during declaration.

4. No Reassignment

const value cannot be changed later.

5. Block Scope

const works inside block {} only.

6. No Redeclaration

Cannot declare same variable again in same scope.

7. Arrays & Objects

With const, array/object contents can change, but variable cannot be reassigned.

8. Best Practice

Use const by default for fixed values.

9. Quick Revision Table

Feature	const
Reassign	No
Redeclare	No
Scope	Block
Must Initialize	Yes
Use Case	Fixed values
