

JavaScript var Variables - Notes

1. What is var?

var is the old way to declare variables in JavaScript.

2. Syntax

```
var a = 10;
```

3. Reassignment

var allows changing value later.

4. Redeclaration

Same variable name can be declared again in same scope.

5. Scope

var has function scope, not block scope.

6. Hoisting

var declarations are hoisted and initialized as undefined.

7. Problems

Redeclaration confusion, scope leaks, hoisting issues.

8. Best Practice

Use let or const in modern JavaScript.

9. Comparison Table

Feature	var	let	const
Reassign	Yes	Yes	No
Redeclare	Yes	No	No
Scope	Function	Block	Block
Hoisting	Yes	Yes (TDZ)	Yes (TDZ)
